## Introducing GreenCore by eco•systems

eco•systems is excited to announce GreenCore, its newest environmentally responsible material that can be widely adopted as a substitute for Sintra in the event and graphic industries. GreenCore offers a super-smooth finish, making it an excellent choice as a direct-print substrate

or for laminated panel applications. GreenCore is made from Forest Stewardship Council Certified (FSC) wood, flax and linseed oil, and ferrous oxide (iron). It is available in 1/8" and 1/4" 4' x 8' sheets in double-sided white, one side white/one side natural, and double-sided natural. GreenCore can be used for most applications currently utilizing Sintra, which contains PVC. PVC is composed of chlorinated toxins, mercury, lead, and dioxins, and is a suspected human carcinogen. GreenCore is all natural, biodegradable, and completely recyclable.
